Abstract—This document provides a solution for the problem of finding slopes of two lines, slope of one line being double of the slope of another line. and tangent of the angle between them is $1/3$.

I. PROBLEM STATEMENT

The slope of a line is double of the slope of another line. If the tangent of the angle between them is $1/3$, find the slopes of the lines.

II. SOLUTION

Two vectors are considered to be passing through origin. Where m_1 and m_2 are slopes of the vectors \mathbf{m}_1 and \mathbf{m}_2 respectively. Let $m_1 = m$. Given $m_2 = 2m$

These vectors can be represented as below:-

$$\mathbf{m}_1 = \begin{pmatrix} 1 \\ m \end{pmatrix} \quad \mathbf{m}_2 = \begin{pmatrix} 1 \\ 2m \end{pmatrix} \quad (1)$$

The dot product of the vectors is given by:-

$$\mathbf{m}_1^T \mathbf{m}_2 = \|\mathbf{m}_1\| \|\mathbf{m}_2\| \cos \theta \quad (2)$$

Given that $\tan \theta$ is $\frac{1}{3}$. By Pythagorus theorem, we can obtain $\cos \theta$ as $\frac{3}{\sqrt{10}}$. Therefore,

$$\cos \theta = \frac{\mathbf{m}_1^T \mathbf{m}_2}{\|\mathbf{m}_1\| \|\mathbf{m}_2\|} \quad (3)$$

$$\frac{3}{\sqrt{10}} = \frac{1 \times 1 + m \times 2m}{\sqrt{1 + m^2} \sqrt{1 + 4m^2}} \quad (4)$$

Applying square on both sides:-

$$9 \times (1 + m^2)(1 + 4m^2) = 10(1 + 2m^2)^2 \quad (5)$$

$$4m^4 - 5m^2 + 1 = 0 \quad (6)$$

$$m_1 = m = 1, -1, \frac{1}{2}, -\frac{1}{2} \quad (7)$$

Substituting the value of m_1 we get value of $m_2 = 2, -2, 1, -1$.

III. CONCLUSION

The slopes m_1 and m_2 of vectors \mathbf{m}_1 and \mathbf{m}_2 for the said conditions are: -

$$\begin{pmatrix} 1 \\ 2 \end{pmatrix}, \begin{pmatrix} -1 \\ -2 \end{pmatrix}, \begin{pmatrix} \frac{1}{2} \\ 1 \end{pmatrix}, \begin{pmatrix} -\frac{1}{2} \\ -1 \end{pmatrix}$$
